Roll No:	67
Class/Sem:	SE/IV
Experiment No.:	5
Title:	Program to display string in Lowercase.
Date of Performance:	07/02/24
Date of Submission:	14/02/24
Marks:	
Sign of Faculty:	

<u>Aim</u>: Program to display string in Lowercase.

Theory:

The program will take Uppercase string as input and convert it to lowercase string. Int 21h is a DOS interrupt. To use the DOS interrupt 21h load with the desired sub-function. Load other required parameters in other registers and make a call to INT 21h.

```
INT 21h/AH = 9

output of string at DS: • String mest be terminated by ""$"

example:

org 100h

mov dx, offset msg

mov ah, 9

int 21h

ret

msg db "hello world $"
```

INT 21h/AH = 0AH – input of string to DS:DX, first byte is buffer size, second byte is number of chars actually read this function does not add '\$' in the end of string to print using INT 21h/AH = 9 you must set dollar character at the end of it and start printing from address DS: DX + 2. The function does not allow to enter more characters than the specified buffer size.

Algorithm:

- 1. Start.
- 2. Initialize the Data Segment.
- 3. Display message -1.
- 4. Input the string.
- 5. Display message-2.
- 6 Take the character count in CX.
- 7. Point to the first character.
- 8. Convert it to Lowercase.
- 9. Display the character.
- 10. Decrement the character coun.
- 11. If not Zero, repeat from step 6.
- 12. To terminate the program, using the DOS interrupt:
 - 1) Initialize AH with 4CH
 - 2) Call interrupt INT 21H.
- 13. Stop.

Program:

```
org 100h
.data
 m1 db 10,13, 'Enter the string in uppercase:$'
 m2 db 10,13,'The lowercase string is:$'
 buff db 80
.code
lea dx, m1
mov ah,09h
int 21h
lea dx, buff
mov ah,0ah
int 21h
lea dx, m2
mov ah,09h
int 21h
mov cl,[buff+1]
lea bx, buff+2
11:
  mov dx, [bx]
  add dx,20h
  mov ah,02h
  int 21h
  inc bx
  loop 11
```

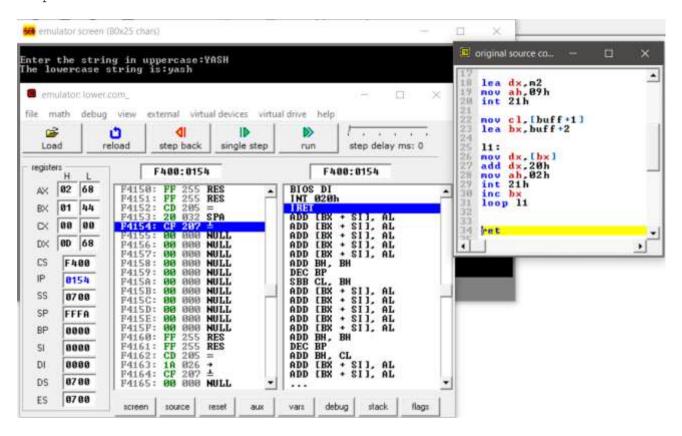

ret

Output:

<u>Conclusion</u>: We successfully converts the input string to lowercase characters, providing a simple and efficient method for transforming text to lowercase format.

1. Explain instruction AAA.

Ans. The instruction "AAA" stands for "ASCII Adjust After Addition." It is a mnemonic used in x86 assembly language programming. This instruction adjusts the result of an addition operation in the AL (accumulator) register to ensure that it remains in the ASCII character range (0x30 to 0x39 for digits '0' to '9'). If the AL register contains a value greater than 9 or the Auxiliary Carry Flag (AF) is set, it adjusts the AL register by adding 6 to it and increments the AH (high byte of AX) register by 1. This instruction is commonly used when performing arithmetic operations on ASCII-coded decimal values to ensure proper representation.

2. Explain instruction AAS.

Ans. The instruction "AAS" stands for "ASCII Adjust After Subtraction." It is a mnemonic used in x86 assembly language programming. This instruction adjusts the result of a subtraction operation in the AL (accumulator) register to ensure that it remains in the ASCII character range (0x30 to 0x39 for digits '0' to '9'). If the AL register contains a value greater than 9 or the Auxiliary Carry Flag (AF) is set, it adjusts the AL register by subtracting 6 from it and decrements the AH (high byte of AX) register by 1. This instruction is commonly used when performing arithmetic operations on ASCII-coded decimal values to ensure proper representation.
